Note of Delayed Mode Quality Control
of Argo float WMO 6901835

24/02/2026

This note includes the results of OWC performed for the WMO 6901835 float. The reference dataset used is composed of the following CTD and Argo historical datasets:

CTD:
CMEMS:
- INSITU_MED_PHYBGCWAV_DISCRETE_MYNRT_013_035
- Coriolis: CTD_for_DMQC_2024V01
- Historical CTD profiles provided through personal contact

Argo:
- ARGO_for_DMQC_2025V03

Float 6901835 is the Arvor float, where the pressure sensor is auto corrected and no adjustment is required.
The OWC was run to estimate a salinity offset and a salinity drift (Cabanes et al., 2016).

Configurations

| Parameters	Value
CONFIG_MAX_CASTS	300
MAP_USE_PV	1
MAP_USE_SAF	0
MAPSCALE_LONGITUDE_LARGE	4
MAPSCALE_LONGITUDE_SMALL	1.33
MAPSCALE_LATITUDE_LARGE	4
MAPSCALE_LATITUDE_SMALL	1.33
MAPSCALE_PHI_LARGE	0.5
MAPSCALE_PHI_SMALL	0.1
MAPSCALE_AGE	10
MAP_P_EXCLUDE	700
MAP_P_DELTA	250
BREAKS	120 366

OWC Results

Figure 1: Location of the float profiles (red line with colored numbers) and the reference data selected for mapping (blue dots).
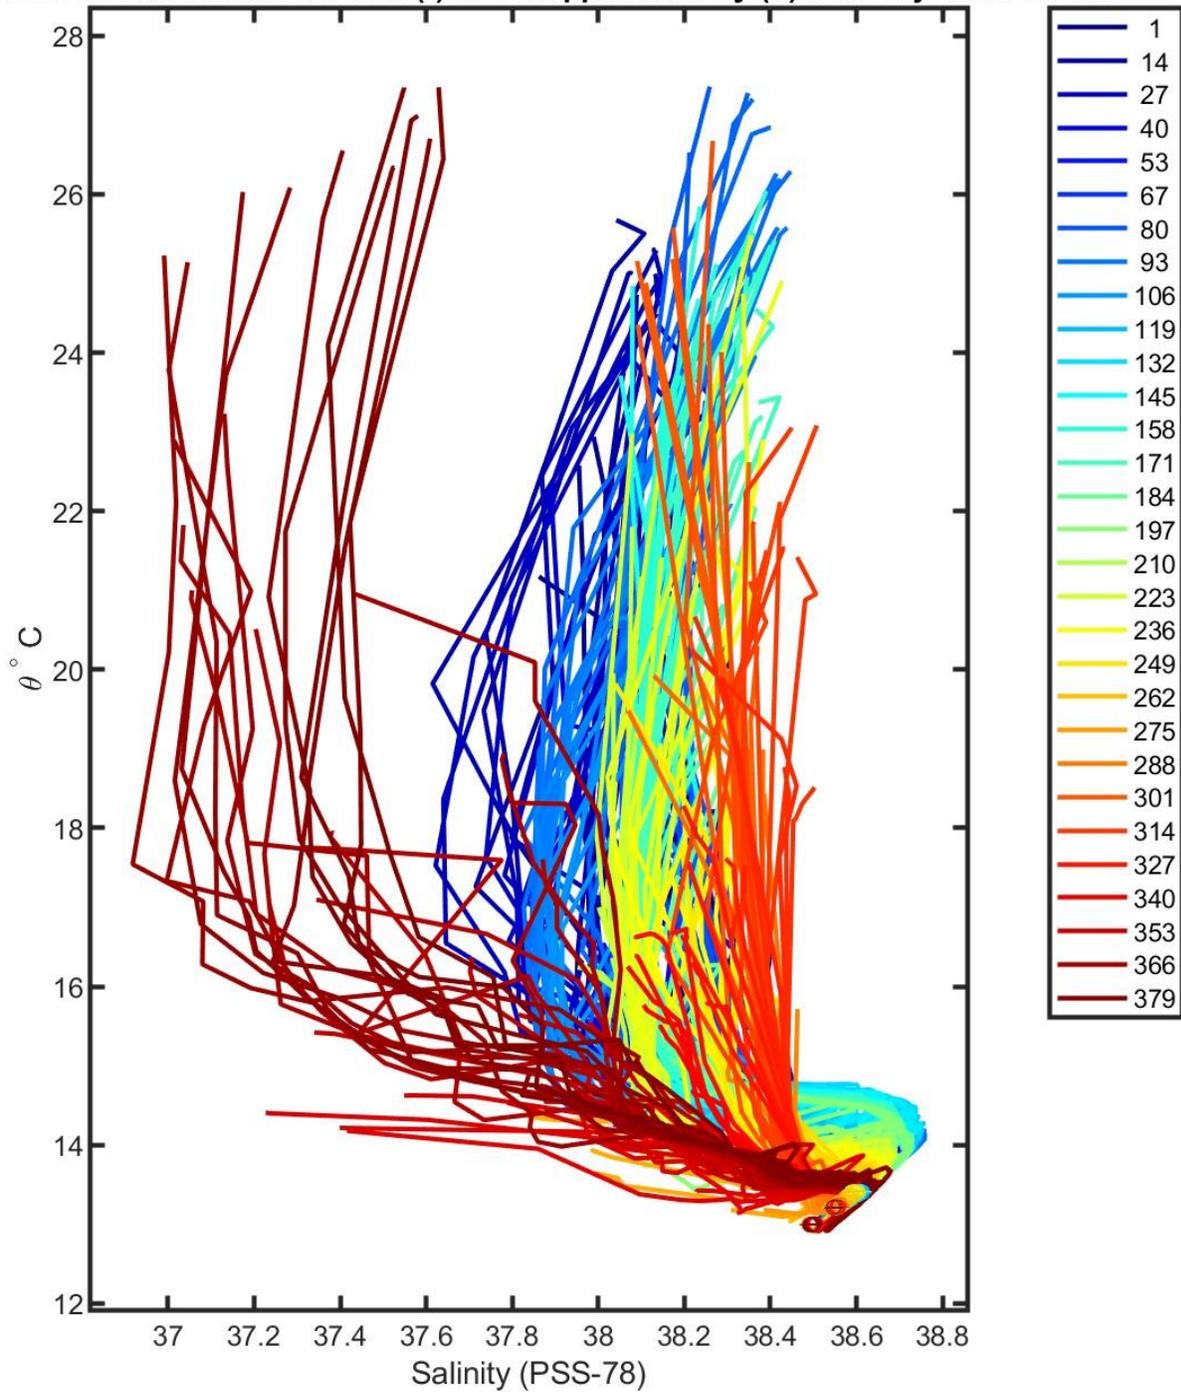

Figure 2: Plot the original float salinity and the objectively estimated reference salinity at the 10 float theta levels that are used in calibration.
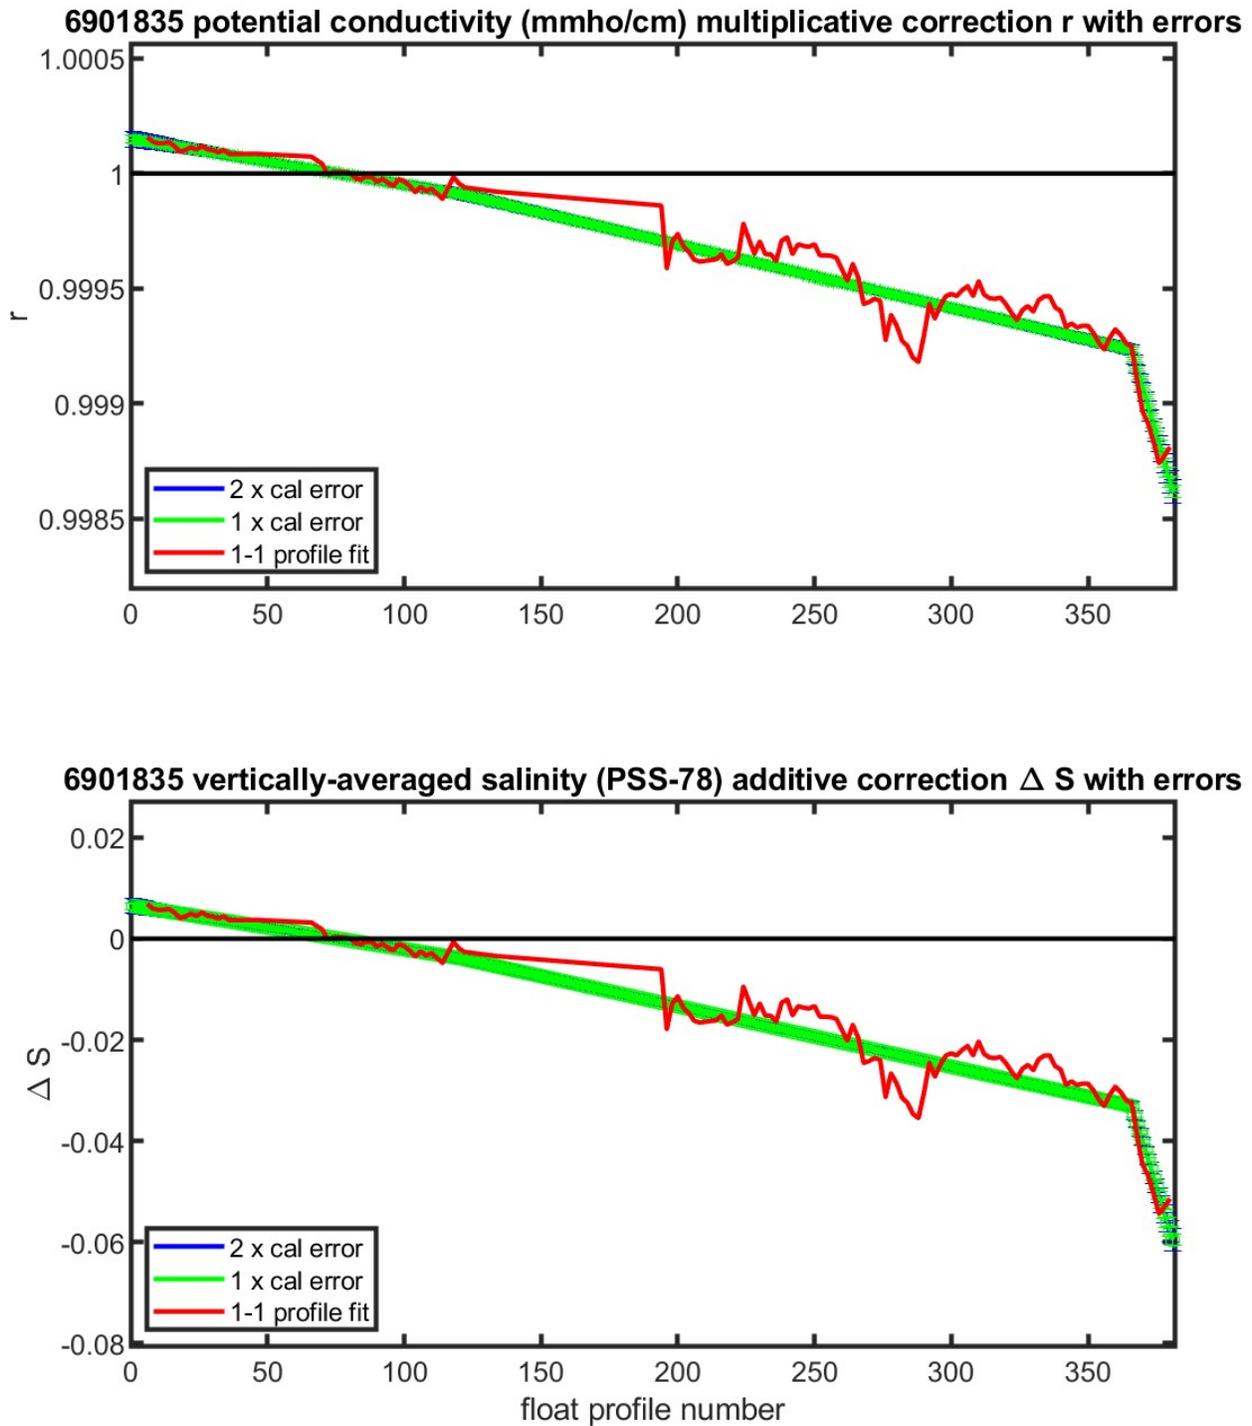

6901835 potential conductivity (mmho/cm) multiplicative correction r with errors

6901835 vertically-averaged salinity (PSS-78) additive correction Δ S with errors

Figure 3: Evolution of the suggested adjustment with time. The top panel plots the potential conductivity multiplicative adjustment. The bottom panel plots the equivalent salinity additive adjustment. The red line denotes one-to-one profile fit that uses the vertically weighted mean of each profile. The red line can be used to check for anomalous profiles relative to the optimal fit.
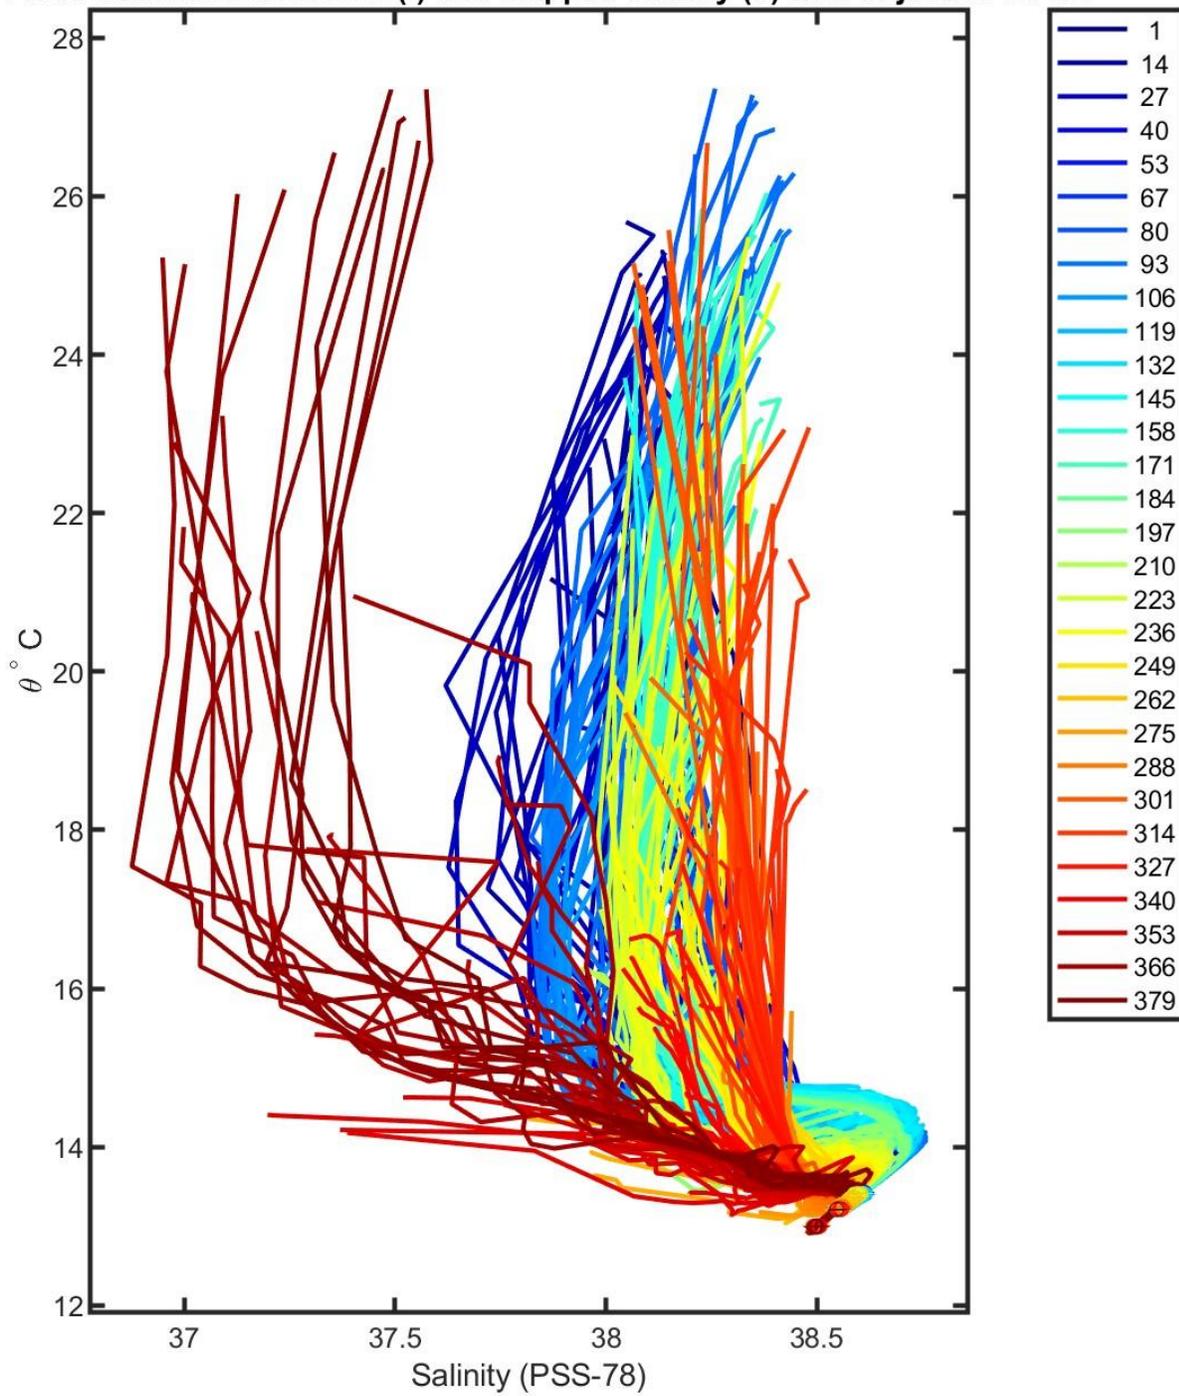

Figure 4: The plot of calibrated float salinity and the objectively estimated reference salinity at the 10 float theta levels that are used in calibration.
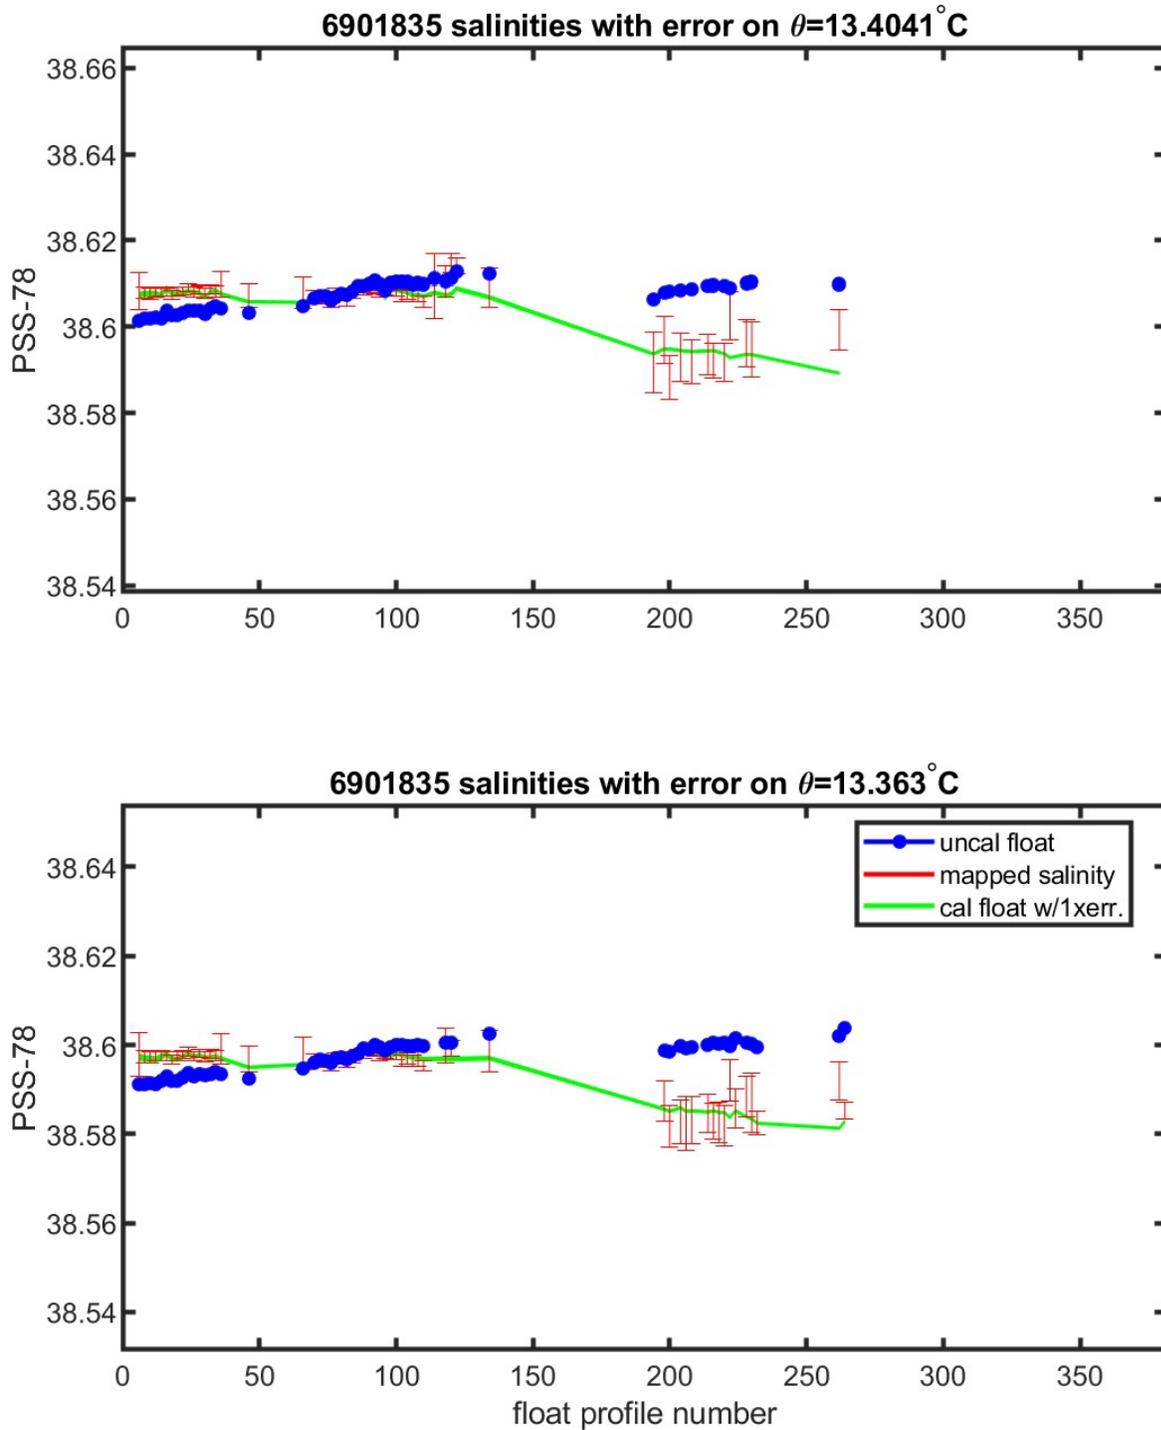

Figure 5: Plots of the evolution of salinity with time along with selected theta levels with minimum salinity variance.
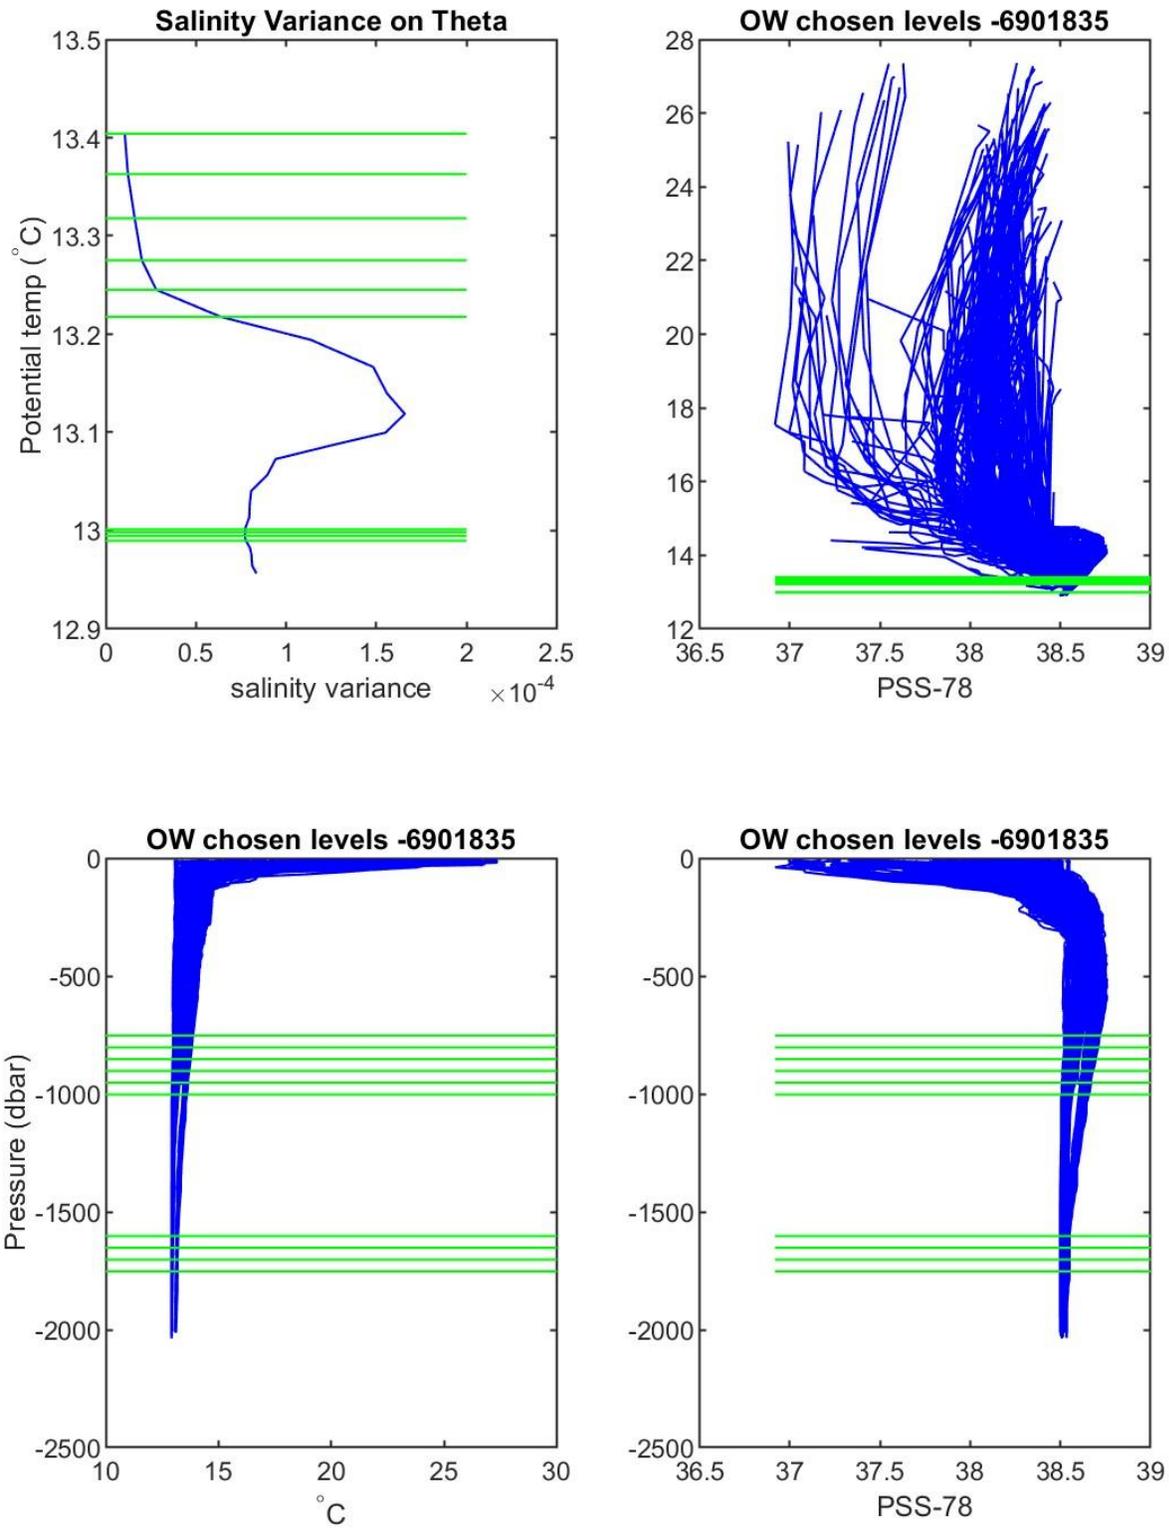

Figure 6: Plots include the theta levels chosen for calibration: Top left: Salinity variance at theta levels. Top right: T/S diagram of all profiles of Argo float. Bottom left: potential temperature plotted against pressure. Bottom right: salinity plotted against pressure.
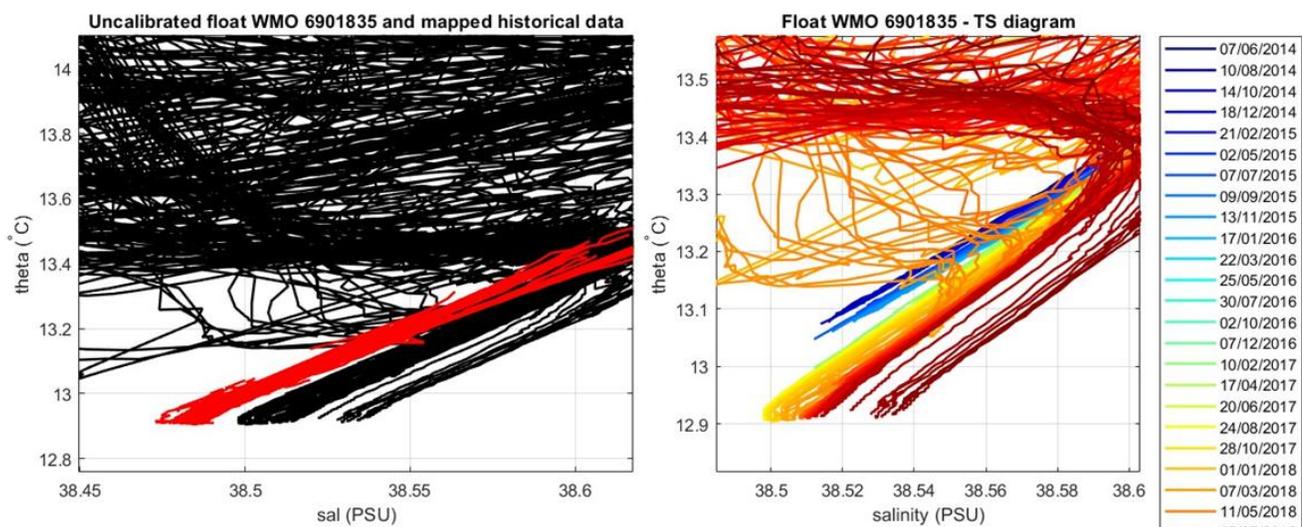

Figure 7: Comparison between float 6901835 and historical CTD on the left and θ-S diagram color-coded per cycle number on the right, in the most uniform part of the θ-S curve.

Summary

Float WMO 6901835 was deployed in the Tyrrhenian sub-basin of the Mediterranean Sea. During its life passed in Ligurian Provencal, Catalan and Algerian sub basins. This float had previously undergone DMQC: no correction was applied and QC 1 was assigned to all cycles (1-118). We applied the OWC method taking into account the deepest profiles. The OWC analysis showed a significant salinity drift with a sudden increase after cycle 366. The correction proposed by OWC exceeds the Argo required accuracy (0.01) and starting from profile 366 is greater than 0.05. Additional analyses (visual inspection of the deepest portion of the θ–S diagram and comparison of selected float salinity profiles with nearby historical CTD profiles) were performed to complement the OWC method and provide the best possible quality control assessment. The last decision is that the salinity data of float WMO 6901835 needs a delayed mode correction for cycles 1-365. QC 1 is applied. Profiles 366-381 are bad, no correction is made and QC 4 is applied.

PSAL_ADJUSTED=PSAL + ΔS from cycle 1 to 365

PSAL_ADJUSTED=PSAL from cycle 366 to 381
The quality flags applied are the following:

PSAL_ADJUSTED_QC='1' from cycle 1 to 365

PSAL_ADJUSTED_QC='4' from cycle 366 to 381

The delayed-mode files (Dfiles) have been created accordingly and sent to the Coriolis GDAC.
